

## Panamera Handle-CAM

NTV-KIT253

### Overview

The Panamera Handle-CAM replaces the factory trunk latch handle in select Porsche Panamera vehicles. Trunk access remains the same via the push button, a high quality camera will capture an image whenever the vehicle is placed in reverse.

### General Installation

1. After removing the factory hatch handle, bolt in the replacement handle-cam. Parts from the OEM handle may need to be retained for the installation.
2. Connect the 2-pin trunk release plug from the factory connector which was removed in the first step to the handle at the two pin port.
3. Extend the 12v barrel connector forward to the dashboard opening (or to the screen input area) with a pair of wires and connect the **ground (black)** wire to a chassis ground (-) and the **power (red)** wire to an accessory 12v (+) source.
4. Extend the yellow RCA signal wire forward with the provided RCA extension cable. **Note: this RCA cable has a red wire built in (which passes all the way through the extension) for convenience of reverse-lamp connection if necessary.**
5. **By default**, this camera will not generate lines for the reverse image. If reverse guidelines are desired from the end user, **remove the 2-pin jumper**.
